

Behaviour of eight established malaria vaccine antigens under Pf-PeptideFilter's criteria

All eight are excluded by the published configuration. Conservation is the filter responsible in every case (panels A and B). Panels A, C and D are settings of the app's own gene-rule slider, not exact peptide fractions: the rule tests an interpolated percentile, so a value here can sit a few points either side of the true share of peptides passing.

● passes this filter ○ fails this filter - - requirement under the published configuration
